### Making Safe Simple®

### Sāfen® High Alert Tags

# Identify the infusion line used for a high alert medication.

71% of the IV medication errors observed involved high-alert infusions, with the most common being heparin, insulin, opioid, and parenteral nutrition.<sup>1</sup>

Safen tags are designed with the intent to reduce risk of medication errors:

 Improve communication and situational awareness for staff, patient and patient's family and support system.

- Triangular shape and color signals medications most often involved in IV medication mistakes.
- Icons and labels are instantly visible to care providers, even in high-stress situations. Space to write supports communication needs.
- Intentionally designed to be a simple, intuitive, "No Tech" solution needing no alarms or computer interface.

1. Wollitz, A., and M. Grissinger. "Aligning the lines: an analysis of IV line errors." Pennsylvania Patient Safety Advisory 11.1 (2014): 1-7.
